

LIFE CYCLE COST CONSIDERATIONS FOR CHOICE OF PAVEMENT TYPE

J. Litzka

Chair for Road Construction and Maintenance
Vienna University of Technology

International Conference Budapest 2009

General requirements for pavement design

- **Structural efficiency during the whole design period**
- **Based on given random conditions**
 - Design traffic load
 - Bearing capacity of subgrade
 - Material properties of pavement layers
- **Minimized Maintenance Costs (surface only)**

Routine pavement design (1)

- **Average or minimum values of**
 - Subgrade
 - Material properties and fatigue behaviour
- **Pavement design according to given design traffic (load class)**
- **e.g. catalogue type**
(like Austrian RVS 03.08.63,
based on analytical calculations)

Routine pavement design (2)

- **Resulting in a number of technically equivalent pavement solutions**
- **Based on availability of materials and/or on cost comparison the optimal solution can be selected together with possible alternatives**
- **But still a general solution based on plausible assumptions, not always most cost effective**

Design table RVS 03.08.63, bituminous pavements

Load class ($n \geq 20$ years)	S	I	II	III	IV	V	VI
DESALts (t/m ²)	< 10 to 25 ¹⁾	< 4 to 10	< 1.3 to 4	< 0,4 to 1.3	< 0,1 to 0,4	< 0,05 to 0,1	< 0,05
construction type 1 bit. base and wearing course unbound subbase							
construction type 2 ²⁾ bit. base and wearing course unbound subbase							
construction type 3 bit. base and wearing course unbound subbase							
construction type 4 bit. base and wearing course unbound subbase							

- bituminous Base and Wearing Course according to the applicable RVS
- unbound Base Course of recycled crushed and milled granulated asphalt pavement, RAC
- unbound Base Course according to RVS 85.05.11, gravel
- unbound Base Course according to RVS 85.05.11, crushed aggregates
- unbound Base Course according to RVS 85.05.12, wet mix-aggregates
- cement-treated Base Course according to RVS 8.05.13
- unbound Subbase according to RVS 85.05.11

Comments:
 1) In case of higher traffic volume a customized structural design is required.
 2) Thickness specifications for asphalt packages are only valid if $E_{sub} > 100 \text{ MN/m}^2$ is reached on wet road.
 unbound base course according to RVS 8.05.13. Otherwise the asphalt thickness values of construction type 1 shall be used.

Possible improvement of economic efficiency (1)

- **Specific analytical design using the underlying procedure for the catalogue, but**
- **Real given values of bearing capacity of subgrade, material characteristics of layers, specific fatigue laws**
- **Also possibility to include new, innovative, not standardised materials**

Essential precondition

- **Exact and reliable information about input characteristics**
- **Performance based laboratory tests (stiffness modulus, fatigue behaviour etc.) functional requirements according to CEN**

- **Traffic forecast of high accuracy**

Benefits of specific pavement design

- **Better adaptation to existing subgrade situation**
- **Better utilisation of material properties**
- **Possibility for innovative materials and solutions**
 - Alternative bids
 - Performance related contracts

Consideration of costs

- **Construction costs**
- **Life-cycle costs**
 - Construction
 - Maintenance
 - Routine
 - Rehabilitation including
 - Traffic management at construction sites
 - Methods/measures
 - Intervals
 - Additional user costs (e.g. time loss)
 - Environmental costs (possibly)

Calculation of life-cycle costs

- **Prognosis of development of pavement condition necessary**
 - **Prediction of life time, change of condition indicator-values and thus prediction of time and type of maintenance measure**
- **Basic tasks for PMS/e.g. VIAPMS**

Change of approach and responsibilities

Actual:

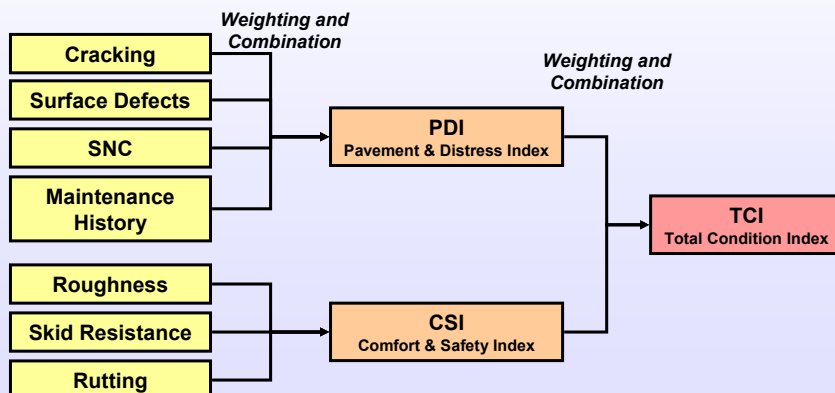

- Only construction costs considered
- Client chooses contractor according to cost comparison
- Sometimes alternatives compared

New approach (even if normal tender):

- Consider life-cycle costs
- At least for road owner costs (construction and maintenance)

Most crucial point: Performance models

- Performance models required for
 - Structural development
 - Surface characteristics (especially for LLPs)

Most crucial point: Performance models (2)

- **Standard- type pavements, traditional materials**
 - Empiric results from database analysis
- **Innovative, new materials and pavements**
 - Prognosis based on analytical calculation

- First assumption based on existing empiric functions and adaptation by periodic condition measurements (normally required in any case)

Optimized solution LCC

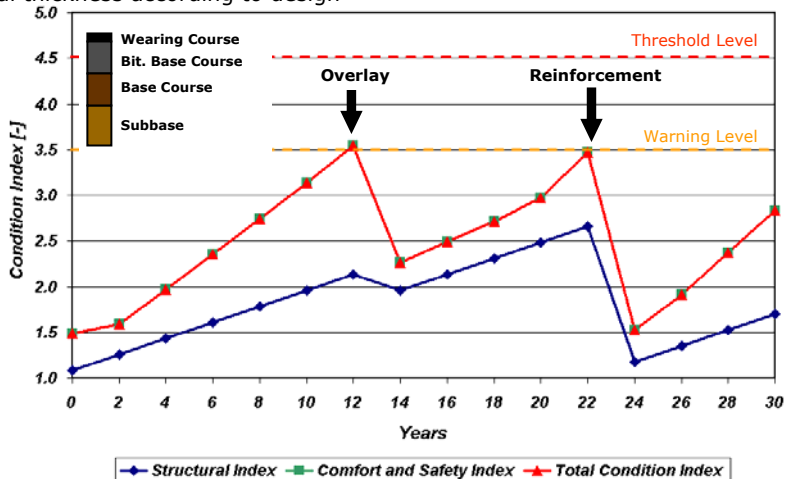

- **Construction costs**
 - **Maintenance costs including additional user costs**
- **Minimum life-cycle costs**
- Most economic solution
 - In compliance with given quality requirements

Development Pavement Condition – Concrete Pavement

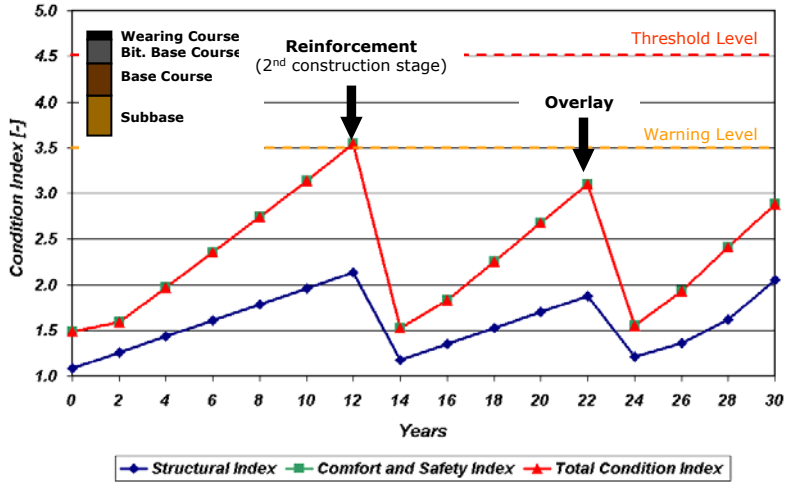

Development Pavement Condition – Asphalt Pavement

Total thickness according to design

Development Pavement Condition – Asphalt Pavement

2-stage pavement construction

Comparison Total Costs (including user costs)

Definition of user costs (1)

- **Austrian research project on "User Cost Module for VIAPMS-Austria" finished 2009**
- **Condition related user costs**
 - Additional time costs
 - Additional vehicle operation costs
 - Additional accident costs

Definition of user costs (2)

- **Additional user costs related to constructions sites**
 - Additional time costs
 - Additional vehicle operation costs
 - Additional accident costs

Additional random conditions

- **Assessment of real construction costs often difficult (competition)**
→ comparative calculations based on alternative bids (example S1 – Wiener Südrandstraße)
- **Avoidance of frequent changes of pavement type (in Austria in the past fixed pavement plan based on function)**
- **Specific high requirements on noise reduction → affordable with PA only**

Conclusions

- **Life cycle cost calculations (including user costs) as valuable tool for decision on pavement type (total economic view, not only road owner's view)**
- **Increased practical application during the decision process, at least for road owner's cost**
- **Stepwise approach recommended (without and with evaluation of user costs)**
- **Sometimes almost no choice because of given random conditions**

Thank you for your attention
